AttiQ Café

Context

- ✓ No promo
- ✓ No festival
- ✓ No competitor shut down
- ✓ Nothing else in Mumbai moved

One day is three times higher than any other day

Today's question

What is your hypothesis, and what is the one query that confirms it?

Bonus question

₹3.4 lakh is sitting in September that should not be. How would you prove the exact amount?

My Answer

“ The aggregate(SUM) is right. The rows are not. ”

Step 1 : Test the rows behind 14 Sep

dq_duplicate_orders_vashi*

Limit to 10000 rows

```sql
SELECT order_id, COUNT(*) AS times_loaded
FROM orders
WHERE store = 'Vashi'
  AND order_date = '2026-09-14'
GROUP BY order_id
HAVING COUNT(*) > 1;

```

Step 2 : Read the result

Result Grid | Filter Rows: | Export:

order_id	times_loaded
AC-220826	3
AC-220827	3
AC-220829	3
AC-220831	3
AC-220835	3

Hypothesis

- H0: Each order_id appears once on 14 Sep.
- H1: Some order_ids appear more than once on 14 Sep

Likely cause

- H1a: JOIN repeats the orders.
- H1b: Data load ran twice.

Corrective action

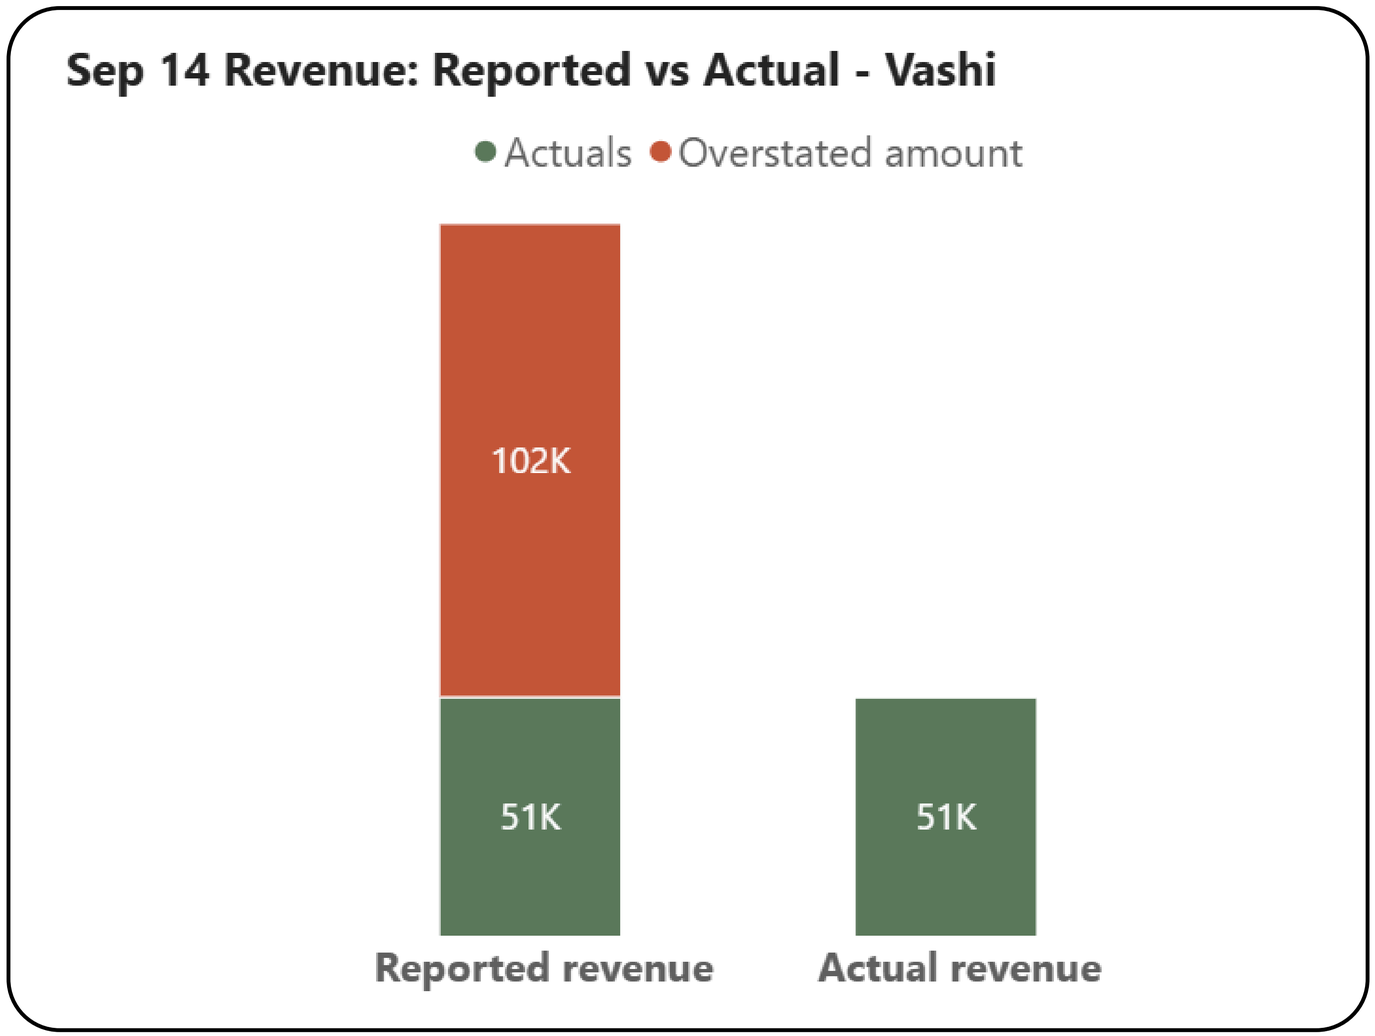

- One row per order_id, then SUM.
- Fix the JOIN or report the data load issue to the data team.

“ First remove duplicates, then aggregate(SUM) it. ”

AttiQ Café

Bonus Answer

“ Fix the one bad day, and the month is right ”

Actuals for 14 Sep

Overstated Amount	=	Reported revenue	-	Actual revenue
₹ 1,02,300		₹ 1,53,400		₹ 51,100

Match the actual revenue with the source system (POS or Finance).

If the two agree to the rupee, the amount is proven.

Day 16 lesson

Before you aggregate the column, check every row is counted once
