

Context

Only 34% of orders carry a loyalty ID. The other 66% are cash and card walk-ins with no customer identifier at all. You cannot tell whether the same person came twice. Not with this data, not by Monday, not ever.

Today’s question

It is Friday evening. What do you do before you log off?

Bonus question

there is a number you genuinely can send on Monday, and it is useful. What is it?

My Answer

“ You can’t calculate what you can’t identify ”

1

Spot the Gap

34 % Identified , 66 % unknown

2

Don’t Guess

Every result needs a proof

3

Flag it today

Tell Ritu before Monday (Communicate effectively)

The fix is not in the formula , it is flagging the gap before Monday becomes a surprise .

Bonus Answer

“ Prove the 34 % ,
Don’t guess the 100 % ”

Repeat rate , Loyalty customer only

Source	• 34 % order with a loyalty ID
Proof	• Every repeat traced to a matched ID
Label	• Loyalty only, not the full walk in base

Day 4 lesson

Communicate honestly, prove with what you have.
