Koramangala - aggregator mix

Today's question

What do you do, and what exactly do you measure?

Bonus question

There is a real risk in going back to look. Name it.

Vishnu Ram Sachin | Data Analyst

My Answer

“Go back and check. Measure the pair. ”

Contribution alone

Store contribution

Tells you cost came down

Not enough

+

Revenue alone

Total revenue

Tells you volume dropped

Not enough

=

Both together

Did it work?

Cost and volume

The pair

“ Contribution shows the profit after costs. Revenue shows if customers stayed. You need both to know it worked. ”

Bonus Answer

“ The risk: it might not have worked. ”

The risk

Going back puts my own recommendation on trial, in public.

It may show I was wrong

Do it anyway

Show the full picture, good and bad. Trusted differently, and I learn if my judgement is any good.

Check my own advice

Day 28 lesson

“ Closing the loop on your own recommendation is the rarest habit in analytics. ”
